A 23 de mayo del 2022.

MRI activity.

Open the simulator in <https://phet.colorado.edu/en/simulations/mri>

### 1. NMR

Place yourself in the tab *Simplified NMR*. Remember that the Larmour relationship relates the magnetic field to the resonant frequency:

$$\nu_L = \frac{\gamma}{2\pi} B_0$$

where  $\nu_L$  is the resonant frequency,  $\frac{\gamma}{2\pi}$  is the gyromagnetic ratio and  $B_0$  is the magnetic field.

Table1. Gyromagnetic ratios for different nuclei.

Nuclei	Gyromagnetic ratio	Nuclei	Gyromagnetic ratio
<sup>1</sup> H	42,58	<sup>65</sup> Cu	12,09
<sup>7</sup> Li	16,55	<sup>75</sup> As	7,291
<sup>9</sup> Be	5,984	<sup>77</sup> Se	8,118
<sup>11</sup> B	13,66	<sup>81</sup> Br	11,50
<sup>13</sup> C	10,71	<sup>87</sup> Rb	13,93
<sup>15</sup> N	4,314	<sup>93</sup> Nb	10,41
<sup>17</sup> O	5,772	<sup>117</sup> Sn	15,17
<sup>19</sup> F	40.05	<sup>121</sup> Sb	10,19
<sup>23</sup> Na	11,42	<sup>127</sup> I	8,518
<sup>27</sup> Al	11,09	<sup>133</sup> Cs	5,584
<sup>29</sup> Si	8,458	<sup>195</sup> Pt	9,153
<sup>31</sup> P	17,24	<sup>199</sup> Hg	7,590
<sup>35</sup> Cl	4,172	<sup>203</sup> Tl	24,33
<sup>51</sup> V	11,19	<sup>207</sup> Pb	8,907
<sup>55</sup> Mn	10,50	<sup>209</sup> Bi	6,841
<sup>59</sup> Co	10,05		

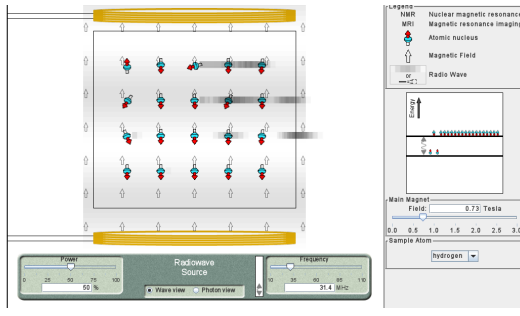

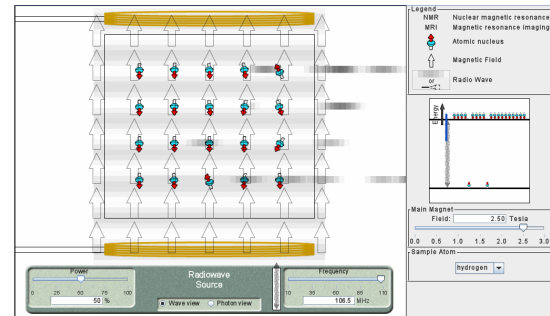

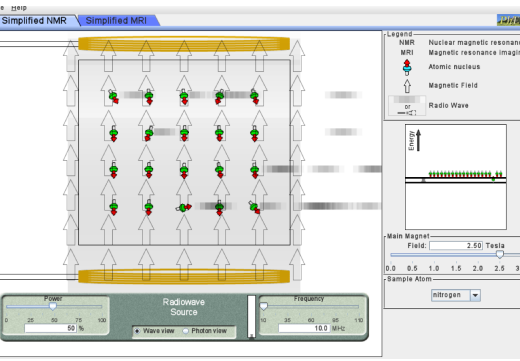

Use the Larmour relationship and the gyromagnetic ratios of various nuclei shown in table 1 to complete table 2. Check your results in the simulation by setting the appropriate frequencies and main magnet field, take a screenshot of the nuclei emitting energy to

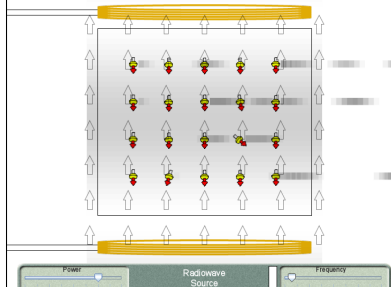

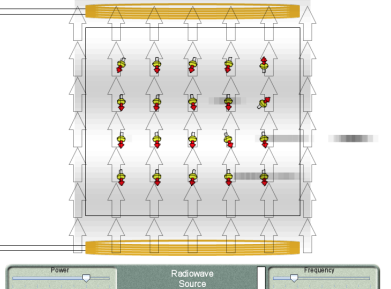

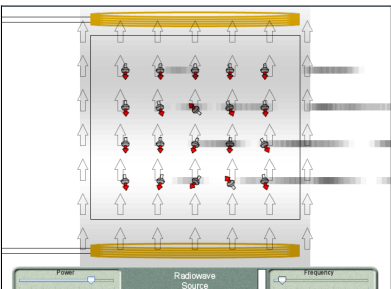

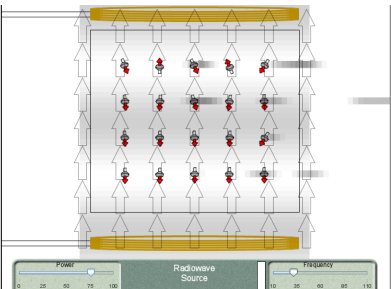

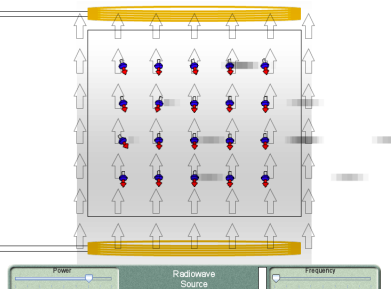

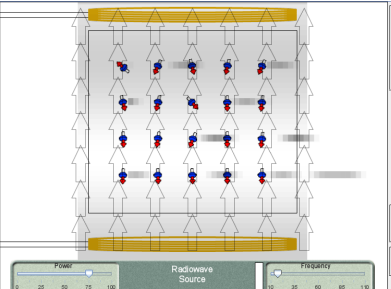

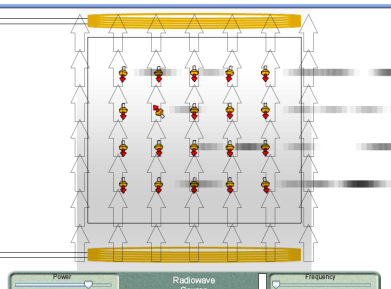

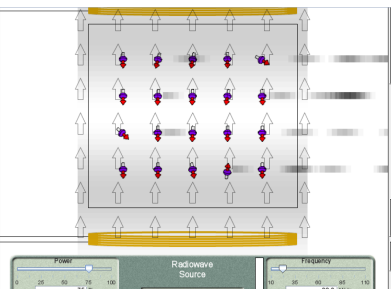

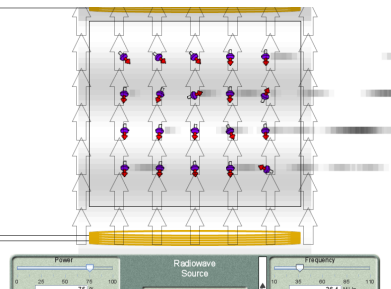

include in the report. Try to find the last nuclei (????) by playing with the simulation and register the frequency at two different magnetic fields.

Table 2. Different settings to achieve energy emission.

Nuclei	Magnetic Field	Resonant Frequency	Magnetic Field	Resonant Frequency
Hydrogen	0.75	<b>31.935</b>	2.5	<b>106.45</b>
Nitrogen	2.5	<b>10.785</b>	-	-
Sodium	<b>1.515</b>	17.3	2.75	<b>31.405</b>
Carbon-13	1.75	<b>18.742</b>	2.5	<b>26.775</b>
Oxygen	<b>1.999</b>	11.54	3.0	<b>17.316</b>
Sulfur	3.0	<b>25.375</b>	-	-
????	1.75	22.0	3	36.4

The last nuclei is Copper

## 2. MRI

Move to the *Simplified MRI* tab

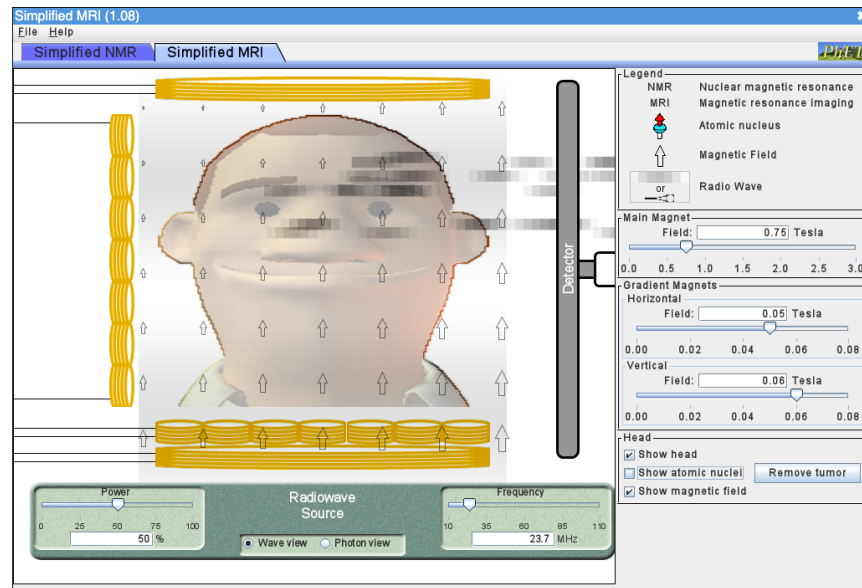

- a. Set the *main magnet field* to 1.0 Tesla, leave the *gradient magnets* in zeros, activate only *show head*, and *show magnetic field* (be sure that *show atomic nuclei* is deactivated), set the frequency in 43 MHz. Finally set the *power* to 50% and observe the flow and distribution of the emissions. After a while observing the emissions, click on *add tumor*, wait for around 7 seconds so the flow distribution stabilizes, look at how the emission changed and try to guess where the tumor is located.

Explain how the emission allowed you to find the correct location:

Since the tumor causes an obstruction in the electromagnetic flow its repercussions on the flow can be key to determine the presence of a tumor, due to the fact that when the flow hits the tumor its flow is disturbed. This can be seen throughout the first moments that the flow is severely disrupted, specially in the areas surrounding the tumor. Once it stabilizes the flow surrounding the tumor is still chaotic, yet the flow on the other sections of the mri is more stable. The detection can be found due to the disruptions on the flow.

- b. Play with the main magnet field, frequency, and gradient magnets (both, horizontal and vertical) to try to obtain an emission focused mainly in the zone of the tumor (register your best guess, it doesn't need to be perfect). Answer the following questions.

Best guess: main magnet: 0.75 Tesla horizontal gradient: 0.05 Tesla vertical gradient: 0.06 Tesla frequency: 23.7 MHz

What happens when the horizontal gradient increases its magnitude? How does it affect the emissions? When the horizontal gradient increases the concentration of the emissions in the area decreases

What about vertical gradient? When the vertical gradient increases the emission increases in the area of the tumor and the emissions are more constant.
